Task 1: Generating Two Different Files with the Same MD5 Hash

Initial few steps:

- 1. Creating files using prefix.txt whose value is "abcdefgh".
- 2. Checking difference between them

```
seed@VM: ~/.../Task1
                                                                   Q =
[06/22/22]seed@VM:~/.../Task1$ md5collgen -p prefix.txt -o out1.bin out2.bin
MD5 collision generator v1.5
by Marc Stevens (http://www.win.tue.nl/hashclash/)
Using output filenames: 'out1.bin' and 'out2.bin'
Using prefixfile: 'prefix.txt'
Using initial value: a0b50a6e2edc375684f9575884b87364
Generating first block: .
Generating second block: W.......
Running time: 2.09926 s
[06/22/22]seed@VM:~/.../Task1$ diff out1.bin out2.bin
Binary files out1.bin and out2.bin differ
[06/22/22]seed@VM:~/.../Task1$ md5sum out1.bin
c458c0654bb51636ea5c9e2a0404e731 out1.bin
[06/22/22]seed@VM:~/.../Task1$ md5sum out2.bin
c458c0654bb51636ea5c9e2a0404e731 out2.bin
```

3. Showing each of the files using 'bless' editor

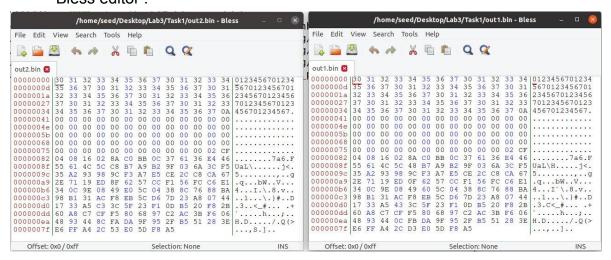

Ques1. When the prefix file is not in the multiple of 64, it will be padded with values such as '1' or '0' like the one above with only 5Bytes value.

Ques2.

Initial code:

Bless editor:

No padding is observed amongst the two files.

Ques3.

01234	01234
	T
h	h
C+.&0	C+.&0
mCMN	mCMN
q.C.(L.{b	q.C.(L.(b
.0qWs3/>	.0qr3/>
[.O.Kq'	[.O.Kq
.`UF{1.s	.`UF{1.s
L.y	GL.y
M =P?gV	M =P?gV
1\$q.o.	1q.o.
3k.S	3k.S.j

What we observe here, that prefix file and padding consist of same particular data. The only difference is of P and Q which are differences like 'Ws' and 'r'

Task 2: Understanding MD5's Property

After applying the following steps:

- 1. Creating two files with MD5 hash
- 2. Checking whether they have the same Hash values.
- 3. Creating a new file
- 4. Concatenating the new file as a suffix
- 5. Checking whether the hash values changed

```
seed@VM: ~/.../Task2
                                                                 Q = - -
[06/23/22]seed@VM:~/.../Task2$ echo -n "01234" > p1.txt
[06/23/22]seed@VM:~/.../Task2$ md5collgen -p p1.txt -o e1.txt e2.txt
MD5 collision generator v1.5
by Marc Stevens (http://www.win.tue.nl/hashclash/)
Using output filenames: 'e1.txt' and 'e2.txt'
Using prefixfile: 'p1.txt'
Using initial value: ed166457be6f75c4eb07fd002255f072
Generating first block: ......
Generating second block: S11...
Running time: 29.3287 s
[06/23/22]seed@VM:~/.../Task2$ md5sum e1.txt e2.txt
8a0e7bbe37d6b4acebaeaaafb43fa307 e1.txt
8a0e7bbe37d6b4acebaeaaafb43fa307 e2.txt
[06/23/22]seed@VM:~/.../Task2$ echo -n "56" > file.txt
[06/23/22]seed@VM:~/.../Task2$ cat e1.txt file.txt > e1.txt
[06/23/22]seed@VM:~/.../Task2$ cat e2.txt file.txt > e2.txt
[06/23/22]seed@VM:~/.../Task2$ md5sum e1.txt e2.txt
9f61408e3afb633e50cdf1b20de6f466 e1.txt
9f61408e3afb633e50cdf1b20de6f466 e2.txt
```

From the above experiment we can conclude that the hash value doesn't change after the addition of a suffix and this property holds true for MD5.

Task 3: Generating Two Executable Files with the Same MD5 Hash

Applying the aforementioned steps:

- 1. Initializing the values of the array
- Generating the output in the file 'Task.out'
- Splitting the file 'Task.out' into 'prefix' and 'suffix'
- 4. Generating two hash file from prefix, 'first' and 'second'
- 5. Checking each of their values
- 6. Adding suffix in them
- 7. Checking their values

```
3 \text{ unsigned char } xyz[200] = {
          0x41, 0x41, 0x41, 0x41, 0x41, 0x41, 0x41, 0x41, 0x41, 0x41,

[06/23/22]seed@VM:~/.../Task3\$ diff first second Binary files first and second differ

Generation of two files from one executable file does lead with the same MD5 hash values with the presence of different prefix and suffix values.

Task 4: Making the Two Programs Behave Differently

Making an executable C program:

```

Making Files with same MD5 hash codes, but resulting in different outcomes.

Combining them with different suffixes, and making them do malicious activities.

```
| Seed@VM:~/.../Task4$ tail -c +12532 a.out > badCode | [06/25/22]seed@VM:~/.../Task4$ tail -c +12533 a.out > goodCode | [06/25/22]seed@VM:~/.../Task4$ cat first >> badCode | [06/25/22]seed@VM:~/.../Task4$ cat second >> goodCode | [06/25/22]seed@VM:~/.../Task4$ chmod +x first second | [06/25/22]seed@VM:~/.../Task4$ chmod +x first second | [06/25/22]seed@VM:~/.../Task4$ ./first | Something malicious | [06/25/22]seed@VM:~/.../Task4$ ./second | All good
```

Even though they have the MD5 hash values, simple difference in suffix makes them behave differently and possibly even maliciously.
